

Web Protection

Why would you leave your data, or more importantly your customers data, only guarded by a single layer of protection? Web Protection provides an additional layer of security by automatically blocking bad URL's and IP addresses using a constantly updated database of over 460 million web addresses and 740 million IP addresses. Many zero-day viruses come from the same source as the last variant so Web Protection can block those viruses and malware before they are detected by traditional antivirus software.

Web Protection also allows your company to manage your employee internet usage through web classification of websites. By denying access to things like social media, dating and gaming sites where you can increase productivity and profits. You can also protect your company and your employees by blocking access to website about violence, drugs and other subjects that can trigger lawsuits or worse.

Innovative Technology Support, Ltd.

Web Protection Features

- › Added layer of security
- › Different from AV, source based vs. signature based
- › Blocks harmful malware at the source
- › Blocks phishing sites to keep company and employee data safe
- › Blocks inappropriate sites on work computers
- › Can also be used for home/parental controls
- › Management control over access to non-work websites
- › Monitoring and reporting of web usage and abuse
- › Agent based so it follows the device
- › Remote installation reduces time and cost to deploy
- › Schedule filtering for “employee-friendly” after hours usage of devices
- › Find devices abusing download and streaming access

Web Protection Helps You

- › Protect Your Data
- › Protect Your Business
- › Protect Your Employees

Web Protection Biz Tips

- › Web Protection is multi-layered security. Adding filtering is a strong component of any security offering.
- › 52% of all security breaches are human related, per CompTIA Trends in Information Security 2015.
- › 42% of all SMBs report actively needing to work on IT Security, per CompTIA’s SMBs and Technology study 2015.
- › Web protection offers a competitive differentiator in a managed service offering against perceived “commodity” MSP plays
- › 64% of employees use non-work related websites every day at work, with 68% wasting up to 2 hours a week, according to Forbes.com. Using web filtering on social media alone saves productivity time per every employee!
- › According to CIO.com, the average direct cost to a small business for a single attack in 2013 (two years ago) was almost \$9,000, not including soft costs.
- › Of the SMBs who are attacked and have a breach, up to 60% go out of business within six months of an attack.
- › Web protection costs \$1/device per month.
